

## Design and Analysis of Algorithms

### Homework # 1

Total Marks = 65

**Q1)** Suppose we are comparing implementations of insertion sort and merge sort on the same machine. For inputs of size  $n$ , insertion sort runs in  $4n^2$  steps, while merge sort runs in  $32 n \lg n$  steps. For which values of  $n$  does insertion sort beat merge sort? [5 Marks]

**Q2)** What is the smallest value of  $n$  such that an algorithm whose running time is  $100n^2$  runs faster than an algorithm whose running time is  $2^n$  on the same machine? [5 Marks]

**Q3)** Perform step-count analysis on the following code fragments. Indicate the time taken by each line of code over the life of the program, then add all individual times to get  $T(n)$ . Where applicable, work in the worst case scenario. Then find an appropriate  $O(f(n))$  for each  $T(n)$ . In order to do this, you must show that there exists a positive constant  $c > 0$ , such that:  $T(n) \leq c f(n)$ . [5\*3 = 15 Marks]

```
(a) int s, i, n;
    cin >> n;
    s = 0;
    for (i = n; i >= 1; i--)
        s++;
```

```
(b) int sum, i, j, n;
    sum = 0;
    cin >> n;
    for (i = 1; i < n; i = i * 2)
        for (j = 1; j < n; j = j * 2)
            sum ++;
```

```
c)  int x = 0, j = n;
    while (j > 0) {
        x += j * 3;
        j /= 4;
    }
```

**Q4)** Consider sorting  $n$  numbers stored in array  $A$  by first finding the smallest element of  $A$  and exchanging it with the element in  $A[1]$ . Then find the second smallest element of  $A$ , and exchange it with  $A[2]$ . Continue in this manner for the first  $n - 1$  elements of  $A$ . Write pseudo-code for this algorithm, which is known as *selection sort*. Why does it need to run for only the

first  $n - 1$  elements, rather than for all  $n$  elements? Give the best-case and worst-case running times of selection sort in  $\Theta$ -notation. [5 Marks]

**Q5)** Prove that  $T(n)$  is  $\Theta(n^3)$  by finding appropriate constants. [5 Marks]

$$T(n) = \frac{1}{8} n^3 - 5n^2$$

**Q6)** What is the runtime of the following function? Express your answer using the big-O notation. Show all working [5 Marks]

```
Function Mystery (n)
{
  If (n > 1)
  {
    Print "hello"
    Mystery(n/5)
    For (i=1 .... n)
      Print "world"
    Mystery(2n/5)
  }
}
```

**Q7)** Use a recursion tree to determine a good asymptotic upper bound on following recurrences. Please see Appendix of your text book for using harmonic and geometric series. (4\*5 = 20 Marks)

a)  $T(n) = 2T(n/4) + O(\lg n)$

b)  $T(n) = 3T(n/2) + O(n)^3$

c)  $T(n) = 7T(n/5) + \Theta(1)$

d)  $T(n) = 2T(n/2) + n/\lg n$

e)  $T(n) = 3T(n - 1) + \Theta(1)$

**Q8)** Do a dry run of count inversion pairs algorithm using divide and conquer approach on following array.

A = [5 8 3 9 2 6 4 1 7 0]

Create a recursion tree of the array and write left, right and split inversion pairs each recursive call of the algorithm. [5 Marks]
